Introduction to Computer Vision

Lab 07: Harris Corner Detection

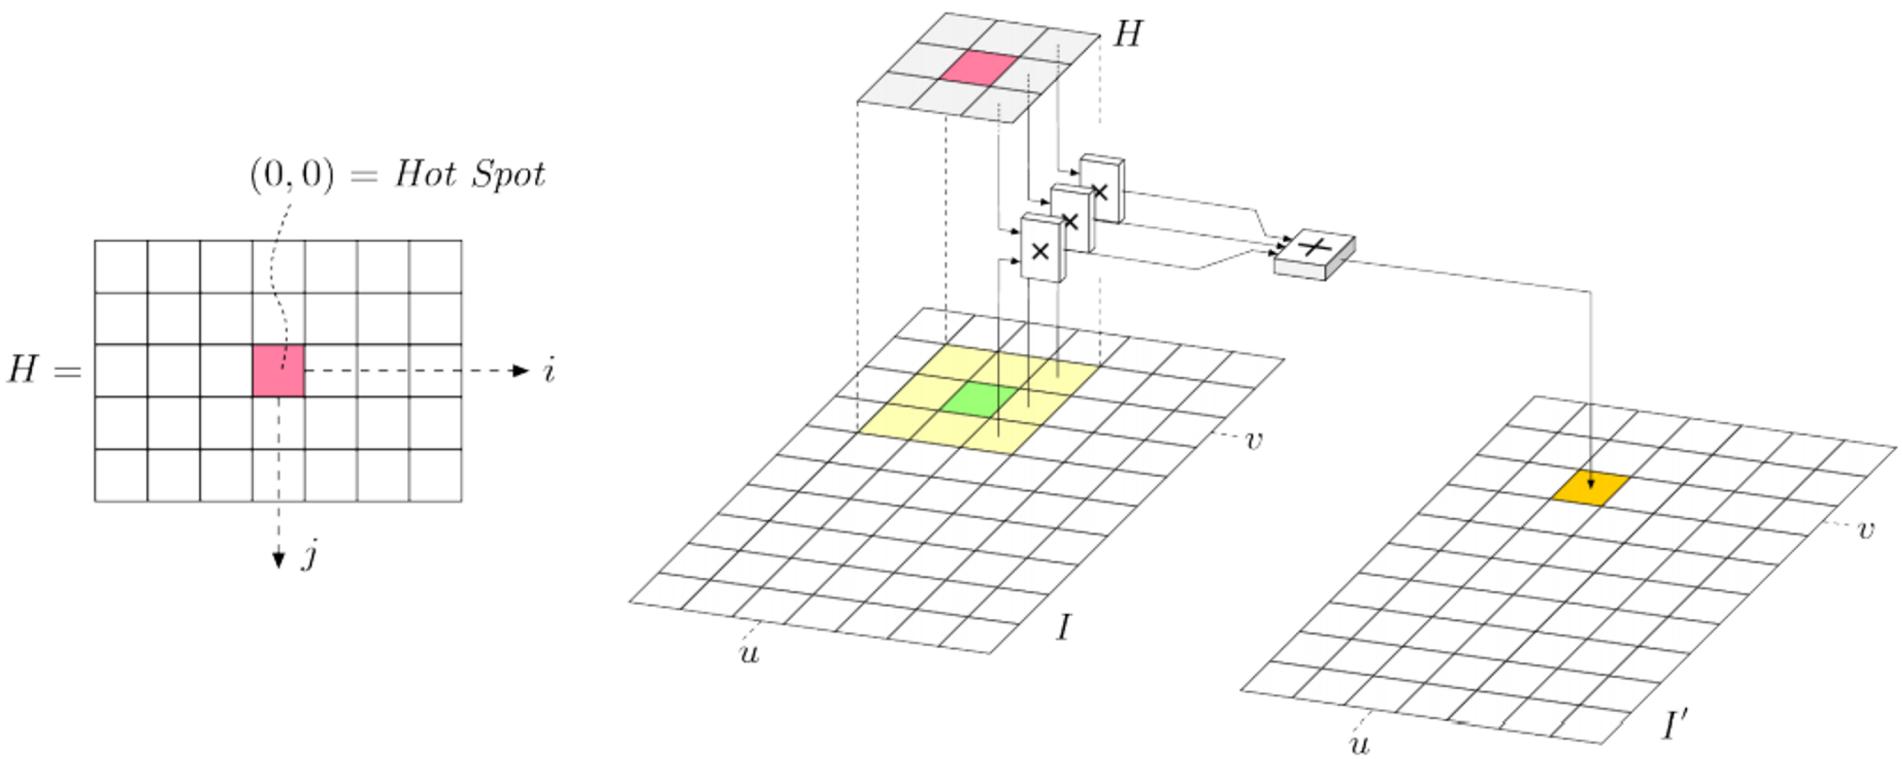

Instructor: Prof. Ming-Hsuan Yang

TA: Taihong Xiao & Tiantian Wang

Spatial Filtering

- Filtering: sliding inner product

$$I'(u, v) = \sum_{i=-1}^1 \sum_{j=-1}^1 I(u + i, v + j) \cdot H(i, j)$$

Spatial Filtering

- Filtering: sliding inner product

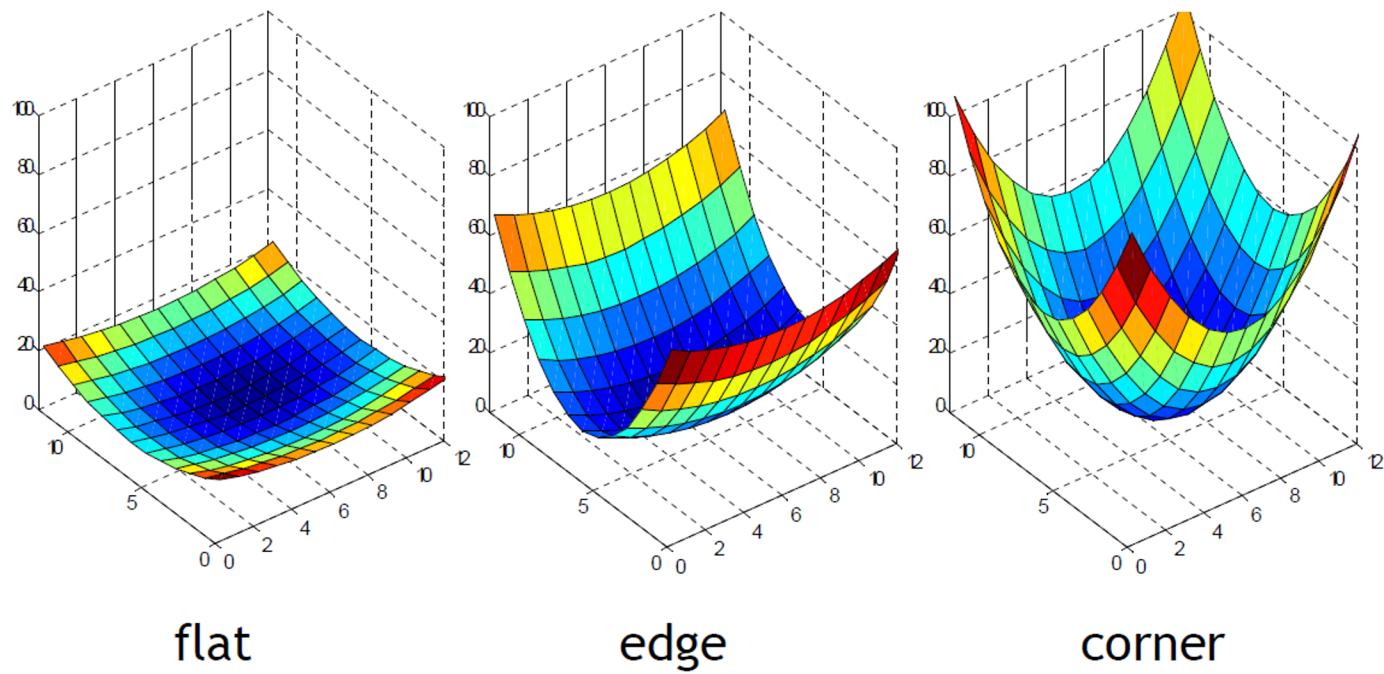

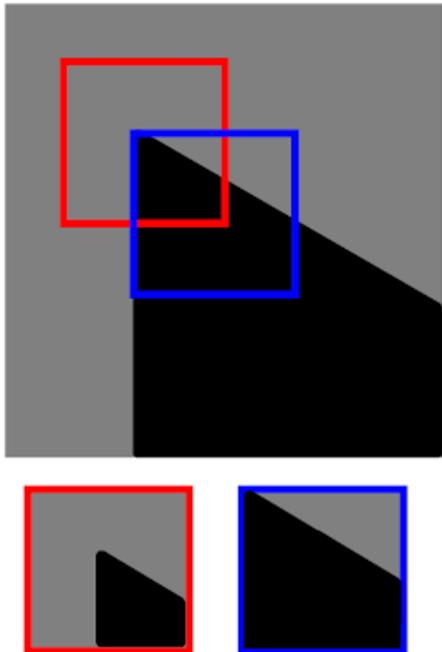

$$I'(u, v) = \sum_{i=-1}^1 \sum_{j=-1}^1 I(u + i, v + j) \cdot H(i, j)$$

- Notation: $I' = I * H$ or $I' = I \otimes H$
- In MATLAB, we use `imfilter(I, H)` to compute spatial filtering
 - use `imfilter(I, H, 'replicate')` to pad boundaries

Harris Corner Detection

- Analysis the change of intensity for the shift $[u, v]$:

$$E(u, v) = \sum_{x,y} w(x, y)[I(x + u, y + v) - I(x, y)]^2$$

Harris Corner Detection

- Approximate $E(u, v)$ with Taylor's expansion:

$$E(u, v) \cong [u \quad v] M \begin{bmatrix} u \\ v \end{bmatrix}$$

- M is a 2×2 matrix computed from image gradients:

$$M = \sum_{x,y} w(x, y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

- Compute the corner response:

$$R = \det(M) - \alpha(\text{trace}(M))^2$$

determinant

Step 1: Image Gradients

- Use derivative of Gaussian (DoG) to compute image gradients:

$$I_x = \frac{\partial G}{\partial x} \otimes I$$

$$I_y = \frac{\partial G}{\partial y} \otimes I$$

– G : Gaussian function/kernel

- Derivative can be calculated by convolution/filtering:

– Sobel: $D_x = \begin{pmatrix} 1 & 0 & -1 \\ 2 & 0 & -2 \\ 1 & 0 & -1 \end{pmatrix}$ and $D_y = \begin{pmatrix} 1 & 2 & 1 \\ 0 & 0 & 0 \\ -1 & -2 & -1 \end{pmatrix}$

– simple one: $D_x = (1 \quad 0 \quad -1)$ and $D_y = \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix}$

Step 1: Image Gradients

- Use derivative of Gaussian (DoG) to compute image gradients:

$$I_x = D_x \otimes G \otimes I$$

$$I_y = D_y \otimes G \otimes I$$

- Filtering is commutative and associative:

$$I_x = D_x \otimes (G \otimes I) = (D_x \otimes G) \otimes I = G \otimes (D_x \otimes I)$$

$$I_y = D_y \otimes (G \otimes I) = (D_y \otimes G) \otimes I = G \otimes (D_y \otimes I)$$

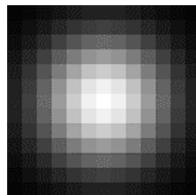

Step 1: Image Gradients

- Method 1: Apply Gaussian filtering to image, and then compute image gradients

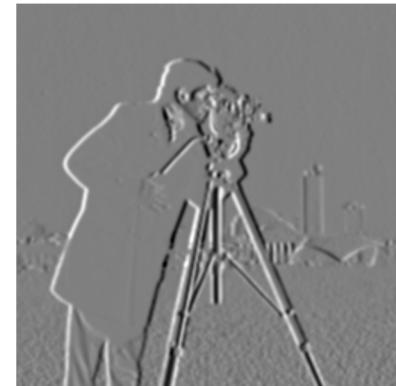

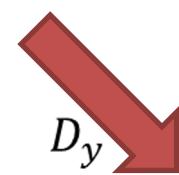

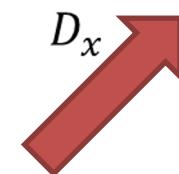

$$I_x = D_x \otimes (G \otimes I) \text{ and } I_y = D_y \otimes (G \otimes I)$$

I

$G \otimes I$

I_x

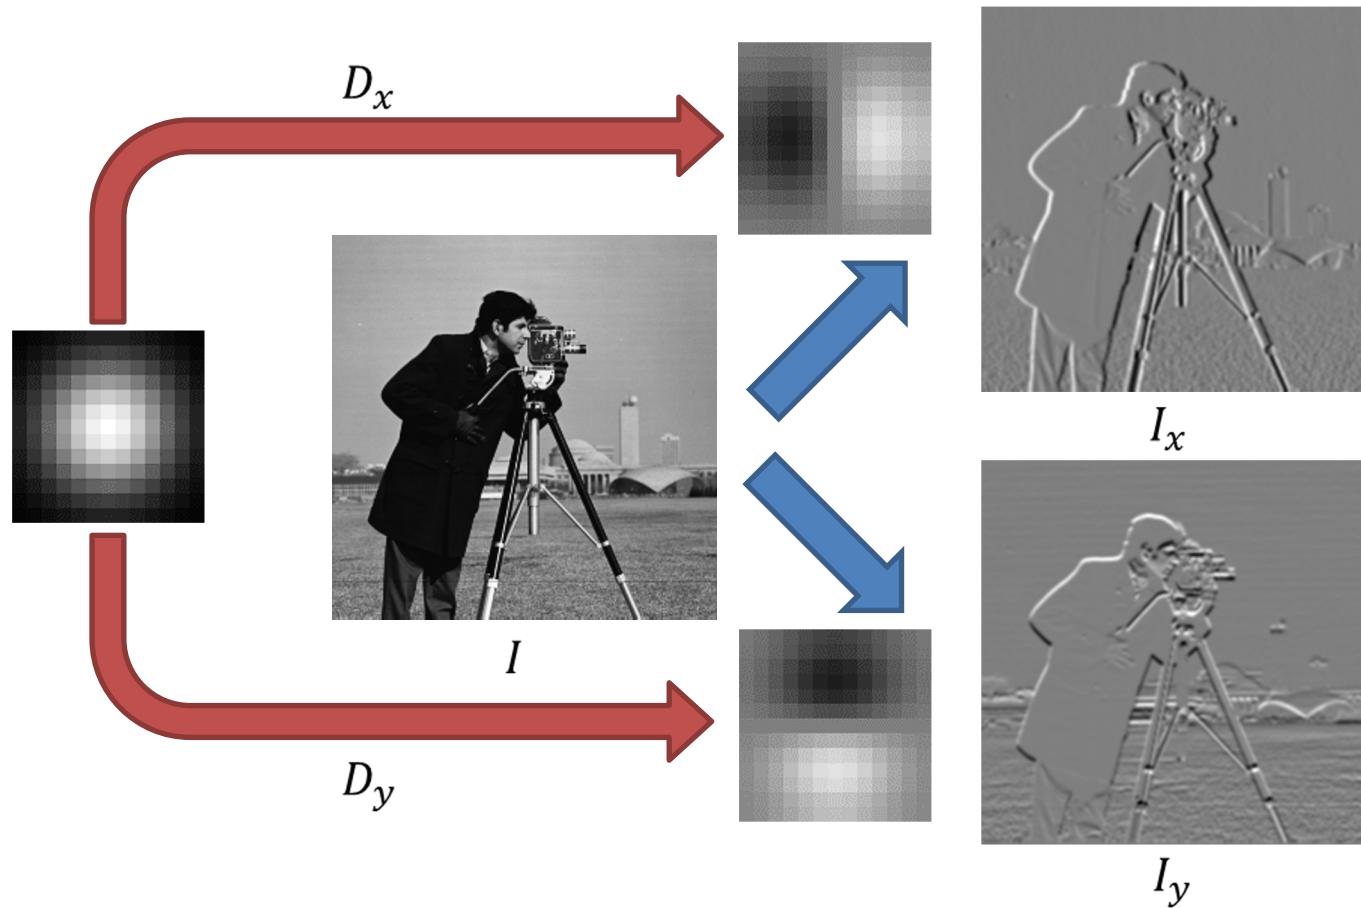

I_y

Step 1: Image Gradients

- Method 2: Compute the derivative of Gaussian, and then apply filtering to image

$$I_x = (D_x \otimes G) \otimes I \text{ and } I_y = (D_y \otimes G) \otimes I$$

Step 1: Image Gradients

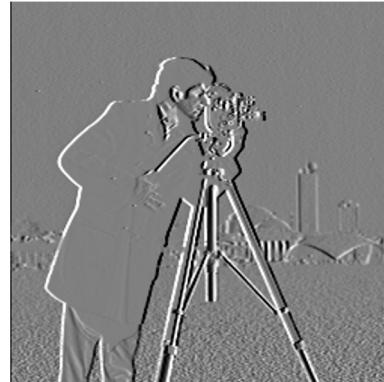

- Method 3: Compute the gradient of image, and then apply Gaussian filtering

$$I_x = G \otimes (D_x \otimes I) \text{ and } I_y = G \otimes (D_y \otimes I)$$

I

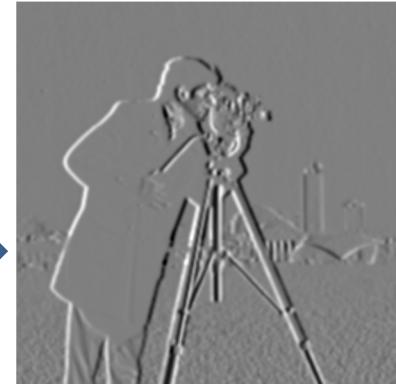

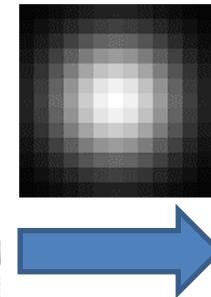

$$\begin{matrix} D_x \\ D_y \end{matrix}$$

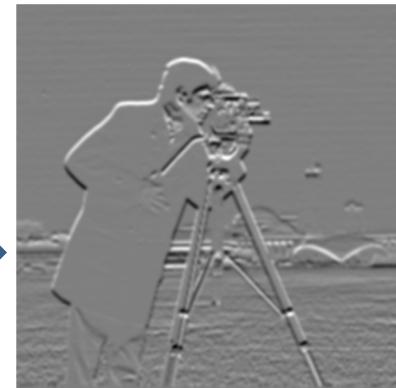

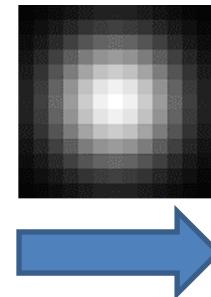

$D_x \otimes I$

$D_y \otimes I$

I_x

I_y

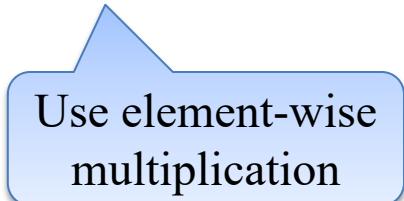

Step 2: Products of Gradients

- Compute products of gradients at every pixel

$$I_{xx} = I_x \cdot I_x$$

$$I_{yy} = I_y \cdot I_y$$

$$I_{xy} = I_x \cdot I_y$$

Use element-wise
multiplication

Step 3: Matrix M

- Use Gaussian filtering to compute the sum of products of gradients at every pixel

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix} = \begin{bmatrix} G \otimes I_x^2 & G \otimes I_x I_y \\ G \otimes I_x I_y & G \otimes I_y^2 \end{bmatrix}$$

$$S_{xx} = G \otimes I_{xx}$$

$$S_{yy} = G \otimes I_{yy}$$

$$S_{xy} = G \otimes I_{xy}$$

Step 4: Corner Response

- Compute the determinant and the trace of M :

$$M = \begin{bmatrix} S_{xx} & S_{xy} \\ S_{xy} & S_{yy} \end{bmatrix}$$

element-wise
• *

$$\det(M) = S_{xx} \cdot S_{yy} - S_{xy} \cdot S_{xy}$$

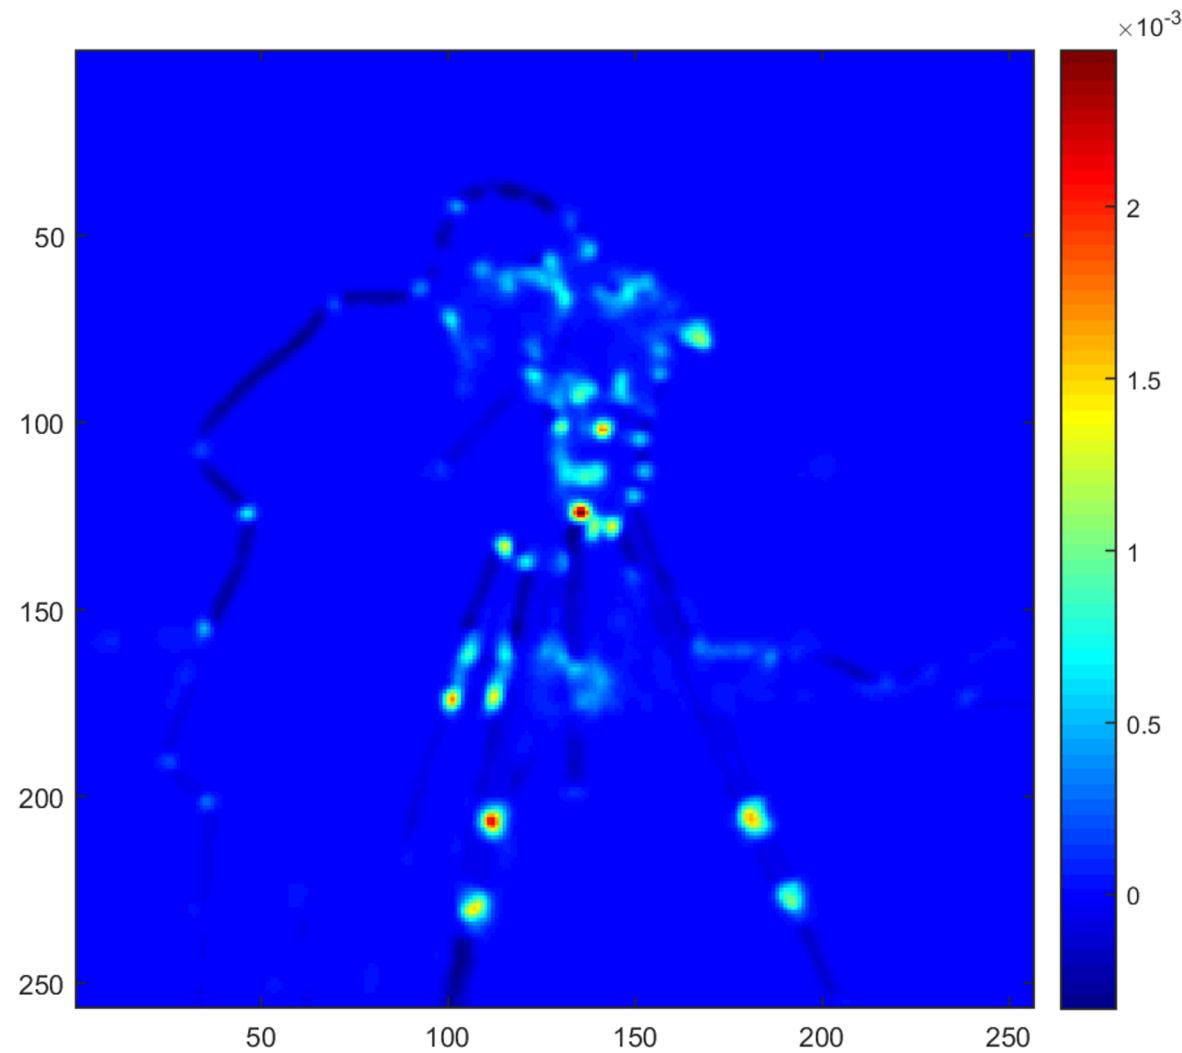

$$\text{trace}(M) = S_{xx} + S_{yy}$$

element-wise
• \wedge^2

- Compute the corner response:

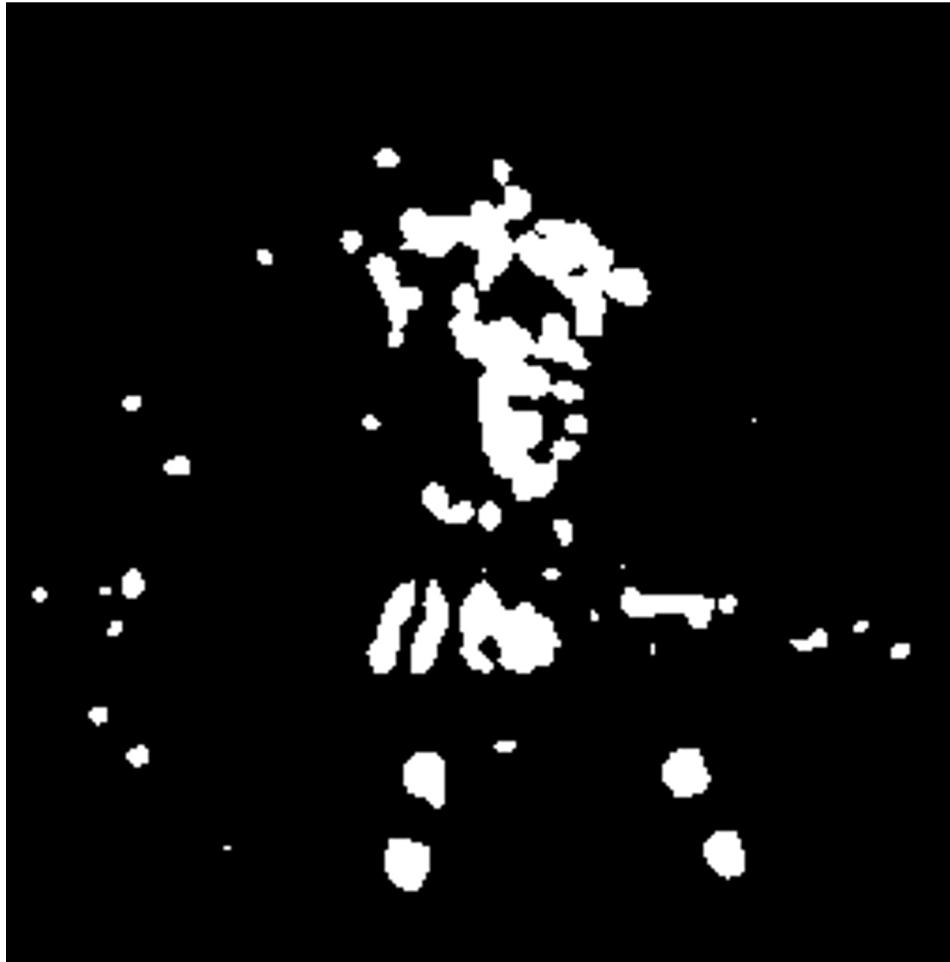

$$R = \det(M) - \alpha(\text{trace}(M))^2$$

Step 4: Corner Response

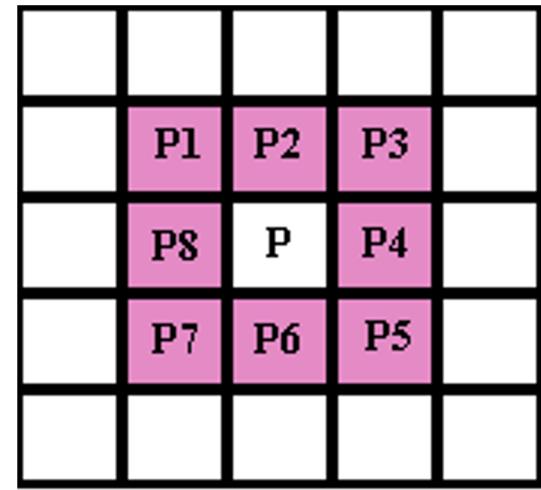

Step 4: Corner Response

- Apply thresholding on R: $R > R_{threshold}$

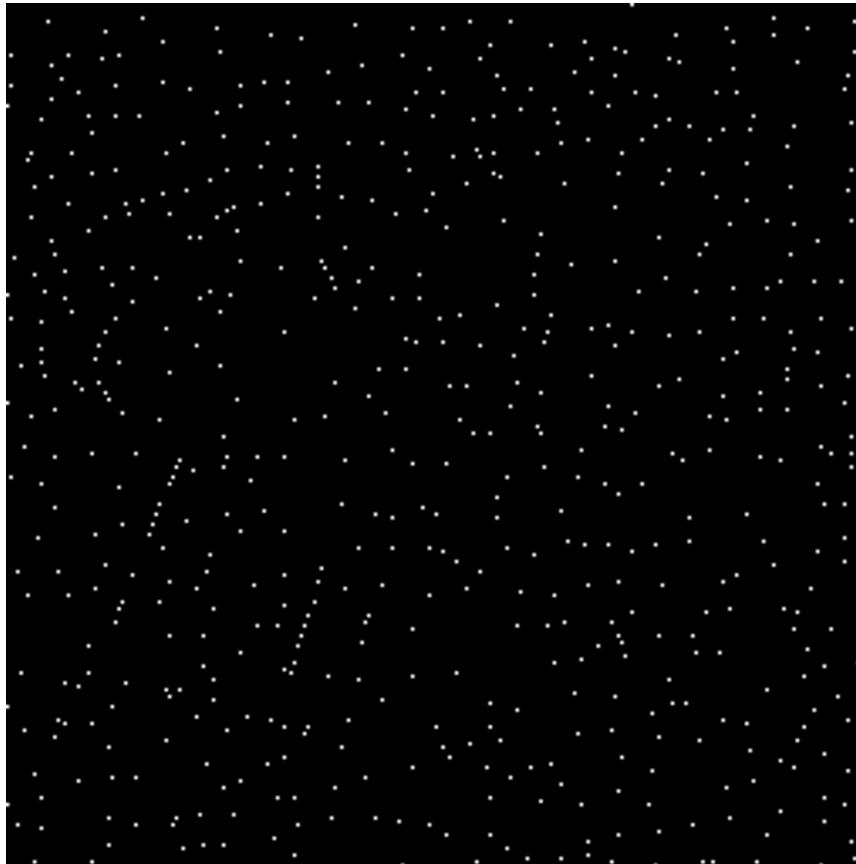

Step 5: Non-maxima Suppression

- Local maxima point should have R value greater than its all 8 neighbors
 - $R(x, y) > R(x - 1, y - 1)$
 - $R(x, y) > R(x - 1, y)$
 - $R(x, y) > R(x - 1, y + 1)$
 - $R(x, y) > R(x, y - 1)$
 - $R(x, y) > R(x, y + 1)$
 - $R(x, y) > R(x + 1, y - 1)$
 - $R(x, y) > R(x + 1, y)$
 - $R(x, y) > R(x + 1, y + 1)$

Step 5: Non-maxima Suppression

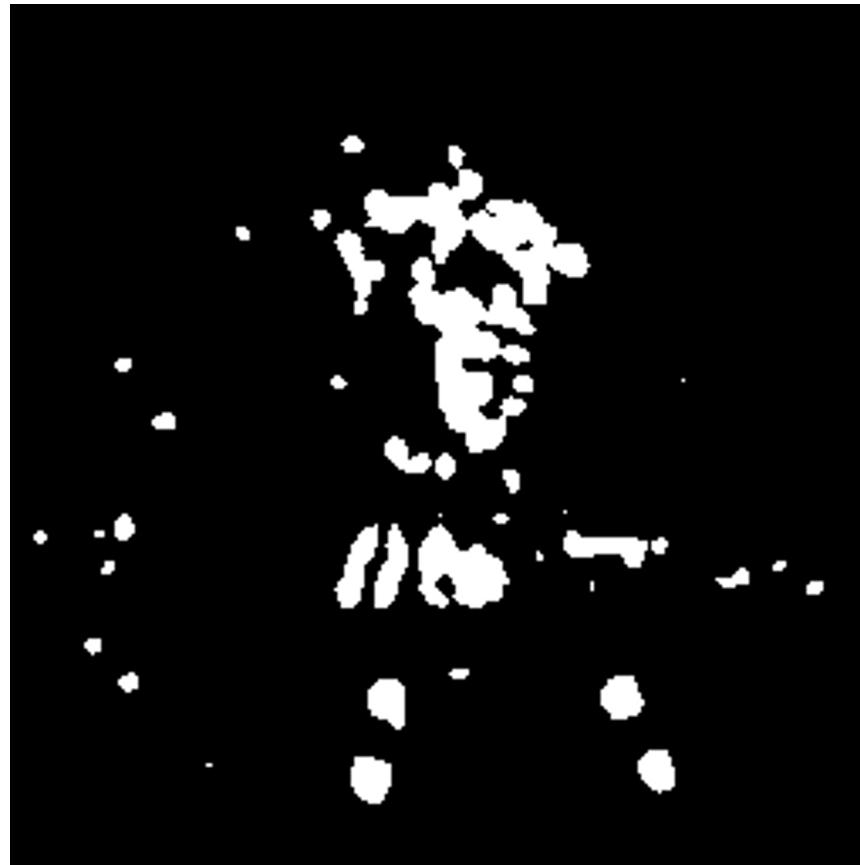

- In MATLAB, use `imregionalmax(R)`
- Bonus: implement your own function

Local Maxima

Step 5: Non-maxima Suppression

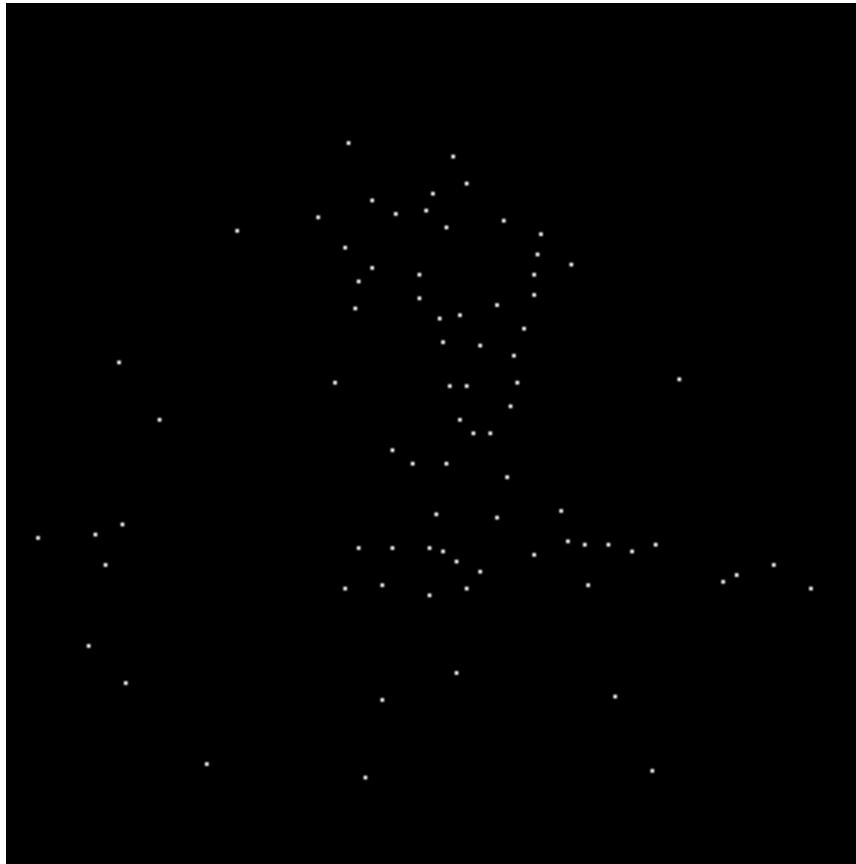

- Apply AND (&) to your corner map and local-maxima

Corner Map

Step 5: Non-maxima Suppression

- Apply AND (&) to your corner map and local-maxima

Final Corner Map

Step 6: Extract corner points and plot

- Use `find` to extract (x, y) of corner points:

```
[corner_y, corner_x] = find(final_corner_map);
```

- Plot corners:

```
%% visualize results
figure, imshow(I); hold on;
plot(corner_x, corner_y, 'ro');
```

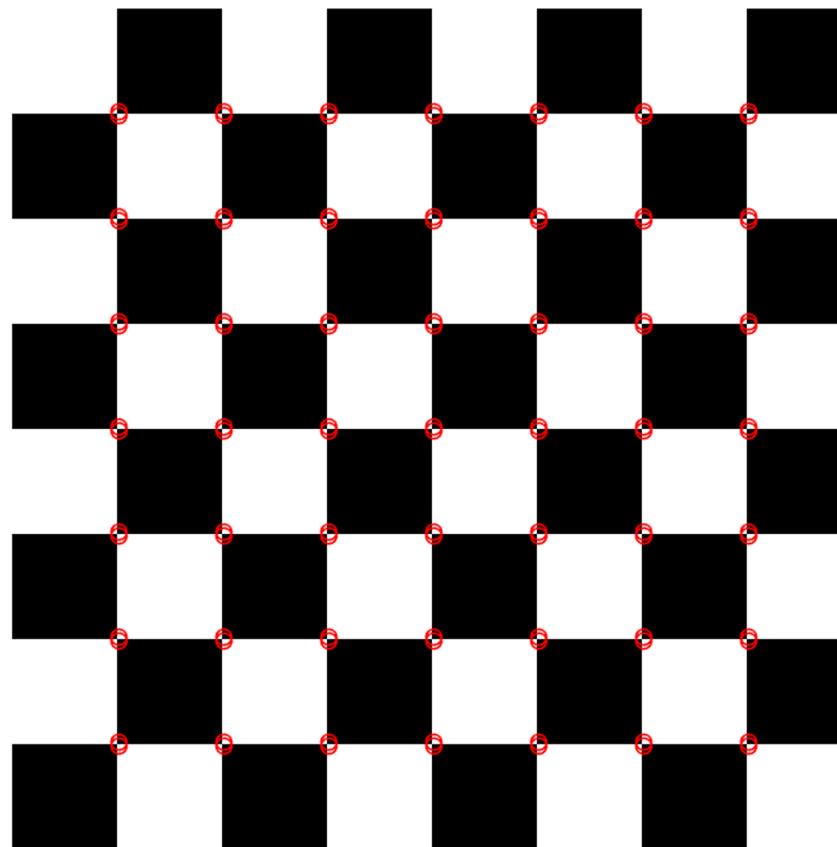

Results: cameraman

Results: baboon

Results: checkboard

Summary

1. Compute x and y gradients:

$$I_x = D_x \otimes (G_1 \otimes I) \text{ and } I_y = D_y \otimes (G_1 \otimes I)$$

2. Compute products of gradients

$$I_{xx} = I_x \cdot I_x \text{ and } I_{yy} = I_y \cdot I_y \text{ and } I_{xy} = I_x \cdot I_y$$

3. Apply Gaussian filtering

$$S_{xx} = G_2 \otimes I_{xx} \text{ and } S_{yy} = G_2 \otimes I_{yy} \text{ and } S_{xy} = G_2 \otimes I_{xy}$$

4. Compute corner response and apply thresholding

$$R = \det(M) - \alpha(\text{trace}(M))^2$$

5. Non-maxima suppression

Different
Gaussians

Lab07 Assignment

- Implement `Harris_corner_detector.m`
- Bonus: implement non-maxima suppression
- Upload `lab07.m`, `Harris_corner_detector.m` and all output images (8 images for each given image) in one folder.
 - * Output images: I_x , I_y and image with Gaussian filtering in Step 1, two Corner responses in Step 4, Local Maxima and final corner map in Step 5, result.
 - * Images must match with the codes.
